# Hands-on Lab: String Patterns, Sorting and Grouping in MySQL using phpMyAdmin

Estimated time needed: 20 minutes

In this lab, you will learn how to create tables and load data in the MySQL database service using the phpMyAdmin graphical user interface (GUI) tool.

#### **Software Used in this Lab**

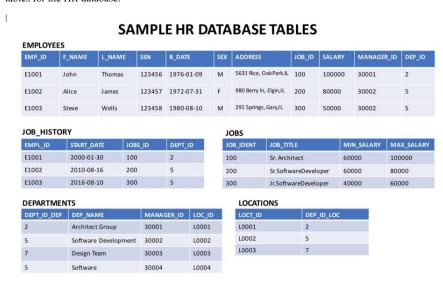

In this lab, you will use MySQL is a Relational Database Management System (RDBMS) designed to efficiently store, manipulate, and retrieve data.

To complete this lab you will utilize MySQL relational database service available as part of IBM Skills Network Labs (SN Labs) Cloud IDE. SN Labs is a virtual lab environment used in this course.

#### **Database Used in this Lab**

The database used in this lab is an internal database. You will be working on a sample HR database. This HR database schema consists of 5 tables called **EMPLOYEES, JOB\_HISTORY, JOBS, DEPARTMENTS** and **LOCATIONS**. Each table has a few rows of sample data. The following diagram shows the tables for the HR database:

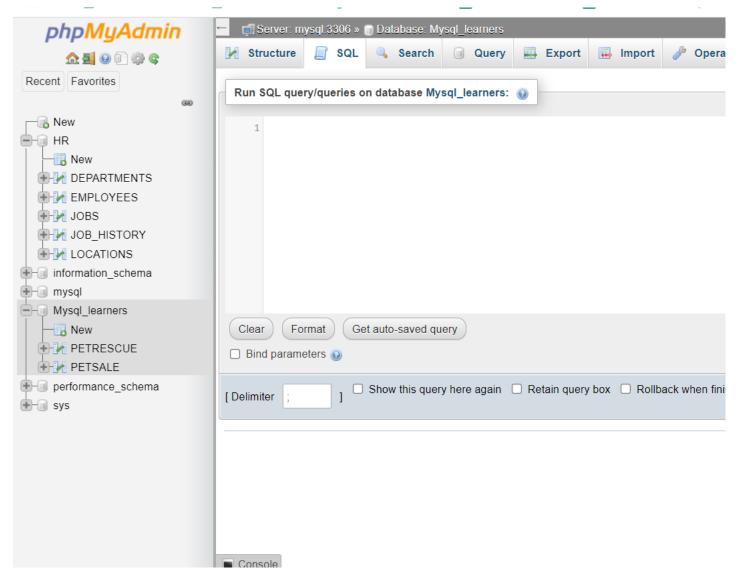

## **Objectives**

After completing this lab, you will be able to:

- Simplify a SELECT statement by using string patterns, ranges, or sets of values
- · Sort the result set in either ascending or descending order and identify which column to use for the sorting order
- Eliminate duplicates from a result set and further restrict a result set

Once the tables are loaded open the sql editor to start executing the functions.

about:blank 1/8

## **Exercise 1: String Patterns**

In this exercise, you will go through some SQL problems on String Patterns.

1. Problem:

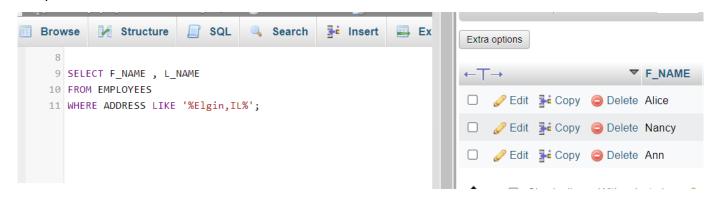

Retrieve all employees whose address is in Elgin,IL.

▼ Hint

Use the LIKE operator to find similar strings.

- ▼ Solution
  - 1. 1
  - 2. 2 3. 3
  - 1. SELECT F\_NAME , L\_NAME
  - 2. FROM EMPLOYEES
  - 3. WHERE ADDRESS LIKE '%Elgin,IL%';

**▼** Output

2. Problem:

Retrieve all employees who were born during the 1970's.

**▼** Hint

Use the LIKE operator to find similar strings.

**▼** Solution

```
1. 1
2. 2
3. 3
1. SELECT F_NAME , L_NAME
2. FROM EMPLOYEES
3. WHERE B_DATE LIKE '197%';
Copied!
```

▼ Output

```
* F_NAME
                                                                              L_NAIVIE
SELECT F_NAME , L_NAME
                                                 Edit
                                                      ≩ Copy
                                                              Delete John
                                                                              Thomas
FROM EMPLOYEES
WHERE B_DATE LIKE '197%';
                                                Delete Alice
                                                                              James
                                                Delete Nancy
                                                                              Allen
                                                🥒 Edit 👫 Copy 🥥 Delete Mary
                                                                              Thomas
```

3. Problem:

Retrieve all employees in department 5 whose salary is between 60000 and 70000.

- ► Hint
- ► Solution
- ▶ Output

## **Exercise 2: Sorting**

In this exercise, you will go through some SQL problems on Sorting.

1. Problem:

Retrieve a list of employees ordered by department ID.

**▼** Hint

Use the ORDER BY clause for this SQL problem. By default, the ORDER BY clause sorts the records in ascending order.

**▼** Solution

```
1. 1
2. 2
3. 3
1. SELECT F_NAME, L_NAME, DEP_ID
2. FROM EMPLOYEES
3. ORDER BY DEP_ID;

Copied!
```

**▼** Output

```
1 SELECT F_NAME, L_NAME, DEP_ID
2 FROM EMPLOYEES
3 ORDER BY DEP_ID;
```

2. Problem:

about:blank 3/8

> Retrieve a list of employees ordered in descending order by department ID and within each department ordered alphabetically in descending order by last name.

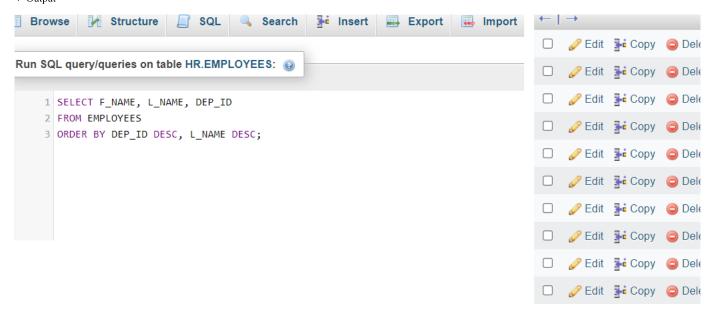

#### **▼** Hint

Use the ORDER BY clause with DESC for this SQL problem.

#### ▼ Solution

- 1. 1 2. 2
- SELECT F\_NAME, L\_NAME, DEP\_ID
   FROM EMPLOYEES
- ORDER BY DEP\_ID DESC, L\_NAME DESC; Copied!

#### ▼ Output

#### 3. (Optional) Problem:

In SQL problem 2 (Exercise 2 Problem 2), use department name instead of department ID. Retrieve a list of employees ordered by department name, and within each department ordered alphabetically in descending order by last name.

#### **▼** Hint

Department name is in the DEPARTMENTS table. So your query will need to retrieve data from more than one table. Don't worry if you are not able to figure this SQL problem out. We'll cover working with multiple tables in the lecture Working with Multiple Tables.

#### ▼ Solution

- 1. 1
- 2. 2
- 3. 3 4. 4
- 1. SELECT D.DEP\_NAME , E.F\_NAME, E.L\_NAME
  2. FROM EMPLOYEES as E, DEPARTMENTS as D
  3. WHERE E.DEP\_ID = D.DEPT\_ID\_DEP

- 4. ORDER BY D.DEP\_NAME, E.L\_NAME DESC;

#### Copied!

In the SQL Query above, D and E are aliases for the table names. Once you define an alias like D in your query, you can simply write  ${\tt D.COLUMN\_NAME}\ rather\ than\ the\ full\ form\ {\tt DEPARTMENTS.COLUMN\_NAME}.$ 

#### ▼ Output

about:blank 4/8

```
Extra options
1 SELECT D.DEP_NAME , E.F_NAME, E.L_NAME
2 FROM EMPLOYEES as E, DEPARTMENTS as D
3 WHERE E.DEP ID = D.DEPT ID DEP
                                                                                              DEP_NAME
                                                                                                                 F_NAME
4 ORDER BY D.DEP_NAME, E.L_NAME DESC;
                                                                                              Architect Group
                                                                                                                 John
                                                                                              Architect Group
                                                                                                                 Ahmed
                                                                                              Architect Group
                                                                                                                 Nancy
                                                                                              Design Team
                                                                                                                 Mary
                                                                                              Design Team
                                                                                                                 Andrea
                                                                                              Design Team
                                                                                                                 Bharath
                                                                                              Software Group
                                                                                                                 Steve
                                                                                              Software Group
                                                                                                                 Santosh
                                                                                               Software Group
                                                                                                                 Alice
                                                                                               Software Group
                                                                                                                 Ann
```

## **Exercise 3: Grouping**

In this exercise, you will go through some SQL problems on Grouping.

**NOTE:** The SQL problems in this exercise involve usage of SQL Aggregate functions AVG and COUNT. COUNT has been covered earlier. AVG is a function that can be used to calculate the Average or Mean of all values of a specified column in the result set. For example, to retrieve the average salary for all employees in the EMPLOYEES table, issue the query: SELECT AVG(SALARY) FROM EMPLOYEES;. You will learn more about AVG and other aggregate functions later in the lecture **Built-in Database Functions**.

1. Problem:

For each department ID retrieve the number of employees in the department.

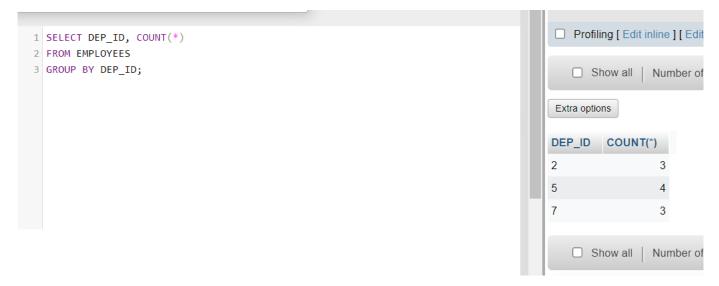

**▼** Hint

Use COUNT(\*) to retrieve the total count of a column, and then GROUP BY.

- **▼** Solution
  - 1. 1
  - 2. 2 3. 3
  - SELECT DEP\_ID, COUNT(\*)
- 2. FROM EMPLOYEES
  3. GROUP BY DEP\_ID;

Copied!

**▼** Output

2. Problem:

For each department retrieve the number of employees in the department, and the average employee salary in the department.

about:blank 5/8

#### **▼** Hint

Use COUNT(\*) to retrieve the total count of a column, and AVG() function to compute average salaries, and then GROUP BY.

#### ▼ Solution

- 1. 1 2. 2
- 2. 2
  3. 3
  1. SELECT DEP\_ID, COUNT(\*), AVG(SALARY)
  2. FROM EMPLOYEES
  3. GROUP BY DEP\_ID;

#### ▼ Output

```
SELECT DEP_ID, COUNT(*), AVG(SALARY)
FROM EMPLOYEES
GROUP BY DEP_ID;
```

Extra options		
DEP_ID	COUNT(*)	AVG(SALARY)
2	3	86666.666667
5	4	65000.000000
7	3	66666.666667

#### 3. Problem:

Label the computed columns in the result set of SQL problem 2 (Exercise 3 Problem 2) as NUM\_EMPLOYEES and AVG\_SALARY.

#### **▼** Hint

Use  $SQL\ Aliases:\ column\_name\ AS\ alias\_name.$  For example,  $AVG(SALARY)\ AS\ "AVG\_SALARY".$ 

#### **▼** Solution

- 1. 1 2. 2
- 3. 3
- SELECT DEP\_ID, COUNT(\*) AS "NUM\_EMPLOYEES", AVG(SALARY) AS "AVG\_SALARY"
   FROM EMPLOYEES
- GROUP BY DEP\_ID;

#### Copied!

#### ▼ Output

```
SELECT DEP_ID, COUNT(*) AS "NUM_EMPLOYEES", AVG(SALARY) AS "AVG_SALARY"
3 FROM EMPLOYEES
4 GROUP BY DEP ID;
```

#### 4. Problem:

In SQL problem 3 (Exercise 3 Problem 3), order the result set by Average Salary..

#### ▼ Hint

Use ORDER BY after the GROUP BY.

#### **▼** Solution

- 1. 1
- 2. 2 3. 3

- 3. GROUP BY DEP\_ID
- 4. ORDER BY AVG\_SALARY;

#### Copied!

### **▼** Output

about:blank 6/8

#### 5. Problem:

In SQL problem 4 (Exercise 3 Problem 4), limit the result to departments with fewer than 4 employees.

**▼** Hint

Use HAVING after the GROUP BY, and use the count() function in the HAVING clause instead of the column label.

```
▼ Solution

1. 1
2. 2
3. 3
4. 4
5. 5
1. SELECT DEP_ID, COUNT(*) AS "NUM_EMPLOYEES", AVG(SALARY) AS "AVG_SALARY"
2. FROM EMPLOYEES
3. GROUP BY DEP_ID
4. HAVING count(*) < 4
5. ORDER BY AVG_SALARY;
```

5. ORDER BY AVG\_SALA
Copied!

```
▼ Output
```

## **Solution Script**

If you would like to run all the solution queries of the SQL problems of this lab with a script, download the script below. Import the script to phpadmin mysql interface and run. Follow Hands-on Lab: Create tables using SQL scripts and Load data into tables on how to upload a script to phpmyadmin console and run it.

• StringPattern-Sorting-Grouping Solution Script.sql

Congratulations! You have completed this lab, and you are ready for the next topic.
