Cheat Sheet: API's and Data Collection

```
Package/Method Description
                                                                                                       Code Example
                               Syntax:
                                  1. attribute = element[(attribute)]
                 Access the
                 value of a
                               Copied!
Accessing
                 specific
                attribute of an Example:
element attribute
                 HTML
                 element.
                                  1. 1
                                  1. href = link_element[(href)]
                                Copied!
                               Syntax:
                                  1. 1
                 Parse the
                 HTML content
                                  1. soup = BeautifulSoup(html, (html.parser))
                of a web page
                                Copied!
                 using
BeautifulSoup()
                 BeautifulSoup.
                               Example:
                 The parser
                 type can vary
                                  1. 1
                 based on the
                 project.
                                  1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                               Copied!
                               Syntax:
                 Send a
                 DELETE
                 request to
                                  1. response = requests.delete(url)
                 remove data or
                 a resource
                               Copied!
                 from the
delete()
                 server.
                               Example:
                 DELETE
                 requests delete
                                  1. 1
                 a specified
                                  1. response = requests.delete((https://api.example.com/delete))
                 resource on
                 the server.
                               Copied!
                               Syntax:
                                  1. 1
                                  1. element = soup.find(tag, attrs)
                 Find the first
                 HTML
                               Copied!
                 element that
find()
                 matches the
                               Example:
                 specified tag
                 and attributes.
                                  1. first_link = soup.find((a), {(class): (link)})
                                Copied!
                               Syntax:
                                  1. 1
                                  1. elements = soup.find_all(tag, attrs)
                 Find all
                 HTML
                               Copied!
                 elements that
find_all()
                 match the
                               Example:
                 specified tag
                 and attributes.
                                  1. all_links = soup.find_all((a), {(class): (link)})
                                Copied!
                               Syntax:
                                  1. children = element.findChildren()
                 Find all child
                                Copied!
                 elements of an
findChildren()
                 HTML
                               Example:
                 element.
                                  1. 1
                                  1. child_elements = parent_div.findChildren()
                               Copied!
                 Perform a
                               Syntax:
get()
                 GET request
```

about:blank 1/4

```
1. 1
                 to retrieve data
                 from a
                                  1. response = requests.get(url)
                 specified
                 ÛRL. GET
                                Copied!
                 requests are
                 typically used Example:
                 for reading
                 data from an
                 API. The
                                   1. response = requests.get((https://api.example.com/data))
                 response
                 variable will
                                Copied!
                 contain the
                 server's
                 response,
                 which you can
                 process
                 further.
                 Include
                                Syntax:
                 custom
                                  1. 1
                 headers in the
                 request.
                                  1. headers = {(HeaderName): (Value)}
                 Headers can
                                Copied!
                 provide
Headers
                 additional
                 information to Example:
                 the server.
                 such as
                 authentication
                                  1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.ge
                 tokens or
                                Copied!
                 content types.
                                Syntax:
                 Import the
                 necessary
                                  1. 1
Import Libraries
                 Python
                                  1. from bs4 import BeautifulSoup
                 libraries for
                 web scraping.
                                Copied!
                 Parse JSON
                 data from the
                 response. This
                                Syntax:
                 extracts and
                 works with the
                                  1. 1
                 data returned
                                  1. data = response.json()
                 by the API.
                 response.json() Copied!
json()
                 method
                                Example:
                 converts the
                 JSON
                 response into a
                                  1. response = requests.get((https://api.example.com/data)) data = response.json()
                 Python data
                 structure
                                Copied!
                 (usually a
                 dictionary or
                 list).
                                Syntax:
                                   1. sibling = element.find_next_sibling()
                 Find the next
                                Copied!
                 sibling
next_sibling()
                 element in the Example:
                 DOM.
                                  1. next_sibling = current_element.find_next_sibling()
                                Copied!
                                Syntax:
                                  1. 1
                                  1. parent = element.parent
                 Access the
                 parent element Copied!
                 in the
parent
                 Document
                                Example:
                 Object Model
                 (DOM).
                                  1. parent_div = paragraph.parent
                                Copied!
post()
                 Send a POST Syntax:
                 request to a
                                  1. 1
                 specified URL
                 with data.
                                  1. response = requests.post(url, data)
                 Create or
```

about:blank 2/4

```
update POST
                                  Copied!
                   requests using
                   resources on
                                  Example:
                  the server. The
                  data parameter
                  contains the
                                      1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                   data to send to
                   the server,
                                    Copied!
                  often in JSON
                   format.
                  Send a PUT
                  request to
                                   Syntax:
                  update data on
                   the server.
                                      1. 1
                  PUT requests
                                      1. response = requests.put(url, data)
                  are used to
                  update an
                                   Copied!
                   existing
put()
                   resource on
                                   Example:
                  the server with
                  the data
                  provided in the
                                      1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                   data
                  parameter,
                                   Copied!
                  typically in
                  JSON format.
                                   Syntax:
                                      1. 1
                  Pass query
                                      1. params = {(param_name): (value)}
                  parameters in
                   the URL to
                                    Copied!
                  filter or
                   customize the Example:
Query parameters request. Query
                   parameters
                                      1. 1
                   specify
                                      3.3
                   conditions or
                  limits for the
                                      1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
                  requested data.
                                      3. response = requests.get(base_url, params=params)
                                   Copied!
                                   Syntax:
                                      1. 1
                                      1. element = soup.select(selector)
                   Select HTML
                   elements from Copied!
select()
                   the parsed
                  HTML using a Example:
                  CSS selector.
                                      1. 1
                                      1. titles = soup.select((h1))
                                   Copied!
                   Check the
                                   Syntax:
                  HTTP status
                   code of the
                                      1. 1
                   response. The

    response.status_code

                  HTTP status
                   code indicates
                                  Copied!
                  the result of
                   the request
                                   Example:
status_code
                   (success, error,
                   redirection).
                   Use the HTTP
                                      3.3
                   status codeIt
